Agenda

- Recap
- Constructor
- Class vs Instances
- Marker constructor
- Glossary
- Challenge

Recap

```
1 class Marker {
2     String nombreColor;
3     short nivelTinta;
4
5     Marker(String color){
6         this.nivelTinta = 100;
7         this.nombreColor = color;
8     }
9 }
10 class E12Constructor {
11     public static void main(String[] args) {
12         Marker marcadorBlanco = new Marker("Blanco");
13     }
```

Methods

As we've seen we have:

- Instance variables (Attributes)
- Constructor

Does a function inside Marker makes sence?

If a function **performs a task** how could it be useful?

Which tasks does a marker is able to perform?

Marker methods

Marker
~nivelTinta : short ~nombreColor : String
~Marker(String): Constructor ~escribir(String): void

Marker methods

Does performing the action "**escribir(String): void**" affect any of our instance variables?

How can we translate this relationship between nivelTinta and escribir()?

this

A Java keyword that can be used to represent an instance of the class in which it appears. this can be used to access class variables and methods.

```
1 for (char letra : <string>.toCharArray())
```

Implementation details

Finally adjust your code to this UML diagram:

Marker
~nivelTinta : short ~nombreColor : String ~colorTinta : String
~Marker(String): Constructor ~escribir(String): void

In your constructor:

nombreColor	colorTinta
Rojo	\u001B[31m
Verde	\u001B[32m
Azúl	\u001B[34m

In escribir method:

```
1 void escribir(String  
  texto){  
2   Sop(this.colorTinta);
```
